Title : Excretory Function of the Stomach in Relation to Neutral
Red Dye with Various Stimulators of the Secretory Process.

Orig Pub : Fiziol. zh. 1957, 3, No 4, 60-66.

Abstract : By using secretion stimulators of various strength (weak -
water, average - 5% solution of alcohol and strong -
meat broth) on various days, excretion by the stomach of a
neutral red dye of (I) was determined in each of 26 pa-
tients. The most intensive and rapidly-progressive excre-
tion of I was obtained with a secretion of gastric juice
in meat broth. The least- in weak stimulus. Intermediate
amount - in alcohol. Secretory and excretory processes
in the stomach are closely connected with each other.

TITLE: System for the generation of the accelerating field of a 70-Gev proton
synchrotron /9

SOURCE: International Conference on High Energy Accelerators, Dubna, 1963.
Trudy. Moscow, Atomizdat, 1964, 932-936

TOPIC TAGS: high energy accelerator, synchrotron, particle beam, magnetic field

ABSTRACT: After the development of a high-precision system of frequency control of
the accelerating field of the proton 50-60 Gev synchrotron with critical energy
compensation (Mints, A. L., et al., Proc. International Conference on High Energy
Accelerators and Instruments, CERN 1959), it was decided to achieve an alternative
accelerator with transition through the critical energy, which makes it possible to
increase the energy to 70 Gev. In this modification of the accelerator serious dif-
ficulties are encountered with the realization of a system for generating an acce-
lerating field with frequency control only according to the H-program. Therefore,

Card 1/3

L 3778-66

ACCESSION NR: AT5007965

it was decided to achieve a system with twin frequency control: rough, according to the H -program, and precise, according to the information on the radial and phase position of the accelerated particle beam. The present report discusses the principal characteristics governing the achievement of a programmed FM-generator, a system of frequency control according to information of the position of the accelerated particle bunches, and accelerator installation. The programmed FM-generator consists of the usual elements: transducer of the derived magnetic field strength (inductive coil in the gap of the measuring electromagnet), electronic switch, tube integrator, modulator, FM-oscillator, phase manipulator, amplitude modulator of accelerating voltage, amplifier-distributor, and a system of cable contacts. To obtain energy increase per revolution of $\Delta E = 166$ KeV for a rate of change of magnetic field strength of $H = 550$ oersteds/second and $\phi_g = 30^\circ$, provision is made for the application of 53 accelerator stations with rated input of 7 kilovolts and 6 kilowatts power. Provisions are also made for the short-duration increase of this voltage, 1.8 times up to the time of beam bunching (around 15 microseconds), and its slow decrease to about 2 times less toward the end of the acceleration cycle with the aim of preserving constant equilibrium phase during the fall in the magnetic field growth rate. The system of frequency control of the accelerating field according to the information on the accelerated particle beam position is similar in

TITLE: Automation of the refrigeration equipment in the Leningrad cold store of Glavmyasorybtorg. (Avtomatizatsiya kholodil'noy ustanovki na Leningradskom kholodil'nike Glavmyasorybtorga).

PERIODICAL: "Kholodil'naya Tekhnika" (Refrigeration Engineering), 1957, No.1, pp.5-10 (U.S.S.R.)

ABSTRACT: The cold store, of 3200 ton capacity, was built in 1913 and was intended for storing frozen fish. It has three storeys, 12 chambers (4 chambers per storey). The chambers are fitted mainly with cooling batteries at the ceiling. The ammonia piping with an upper distribution of the ammonia is sub-divided into two parts, one part for the southern side of the cold store, the other for the northern side; the separators of the liquid ammonia are located in the garret. The machinery is in a separate building and consists of two horizontal Borsig compressors of a refrigeration capacity of 150 000 and 350 000 N kcal/hr which are driven by 140 and 55 kW motors respectively. The following processes were automated: maintenance of a given temperature of the refrigerated chambers, feeding of the cooling agent into the liquid separators, feeding of the cooling agent from the liquid separators into the batteries of the individual chambers, protection of the refrigeration

"The Root of Life [Ginseng]," M. A. Zhukovskiy

"Nauka i Zhizn'" Vol XIX, No 1, p 46

Small doses of ginseng have a stimulating effect on the nervous system, while large doses have a depressing effect. USSR scientists established that ginseng contains 5 physiologically active substances: panaxin, which has a stimulating effect on the middle brain and a tonic one on the cardiovascular system; panaxic acid, which stimulates metabolism and the cardiovascular system;

203788

USSR/Medicine - Drugs (Contd.) Jan 52

panaquillon, a glucoside stimulating the endocrine system; panacen, an essential oil which exerts an action on the nerve centers of the large brain and the medulla; ginsenol, which has a beneficial effect in diabetes. Ginseng roots on cleaning are boiled in sugar syrup and then dried. A 10% solution in 70% alcohol is used in medicine: 20-30 drops are taken 30 min before meals. Contraindications are high blood pressure, arteriosclerosis, etc.

"Nauka i Zhizn'" Vol XIX, No 3, p 48

The drug pantocrine is being extracted from the antlers of young deer according to a method developed by Prof S.M. Pavlenko. Pantocrine has a general tonic effect. It stimulates the cardiovascular system, the activity of the gastrointestinal tract and of the kidneys, increases the nitrogen and carbohydrate metabolism, and removes the feeling of fatigue. It is beneficial in neuroses

216740

due to overstrain, weakness of the nervous system, or general debility. The drug is taken orally or administered subcutaneously. The spotted "maral" deer from whose antlers pantocrine is extracted are being bred at special sovthozes in the Far East and Southern Altay.

Oct 53

"Epidemic Hepatitis," M.A. Zhukovskiy, Cand Med
Sci (Moscow)

Fel 1 Akusher, No 10, pp 28-30

Since there are several diseases which are similar to epidemic hepatitis, but are different in origin, it is necessary to use extreme care in formulating the diagnosis. In cases of leptospiral jaundice the liver becomes greatly enlarged and painful; kidney trouble, a petechial rash on the skin, and sharp muscular pain are noted. Leptospiral

268140

jaundice is also accompanied by an accelerated erythrocyte sedimentation rate. Since rats are usually the source of leptospiral jaundice, the infection is commonly contracted by those people who come in contact with rodents. As in epidemic hepatitis, recovery from leptospiral jaundice depends greatly upon the condition of the morbid organism in general and of the nervous system in particular. No specific method of treatment resulting in the destruction of the epidemic hepatitis virus has yet been discovered.

AUTHOR: Zhukovskiy, N.A., Learned Secretary of the Scientific Planning Committee at the Presidium of the USSR Academy of Medical Sciences.

TITLE: The Standard of Living and Health (Obraz zhizni i zdorov'ye). Session in Minsk (Sessiya v Minske).

PERIODICAL: Nauka i zhizn', 1958, Nr 7, pp 7-8 (USSR)

ABSTRACT: The session summoned by the Presidium of the USSR Academy of Medical Sciences discussed the planned development of Soviet medical science over the next 7 years (from 1959 to 1965) and also three scientific topics of utmost importance - the standard of living and health, gerontology and liver diseases. The continuous prosperity increase, better conditions of work and life have lead to a considerable prolongation of average longevity and now the necessity has arisen to study the social, hygienic, biological and physiological factors influencing the health of older people. During the session the Member of the USSR Academy of Medical Sciences, N.N. Gorev and the scientific worker A.P. Cherkasskiy reported on the basic studies of the longevity problem in the USSR. S.P. Botkin informed the session on his results in investigating the aged. Professor Anna Aslan, Director of the Institute of Gerontology in Roumania also

Determination of Purely Circulatory Flows Around Profiles
(Original text in Russian), M. E. Zhukovskiy; App. Math. & Mech.
(USSR) July-Aug '49 (12-4 Bf-Mikhil); pp 457-458; 2 illus, 10 eq.

Investigation of a plane potential flow around an isolated profile is presented by a total of three types of flow: (1) non-circulatory, having an infinite direction, parallel to the axis x; (2) noncirculatory, having an infinite direction along the axis y; and (3) a purely circulatory flow. The term expressing the speed of the resulting flow on the surface of the profile can be formulated by:

$$v(s) = V_{\infty} \left[u_x(s) \cos \alpha + u_y(s) \sin \alpha \right] + \frac{\Gamma}{b} u_r(s)$$

where V_{∞} = the speed in the infinity, α = the angle of attack, b = the profile chord, Γ = the rate of speed over the contour of the profile, $u_x(s)$ and $u_y(s)$ = velocities on the surface of the profile which corresponds at $V_{\infty} = 1$, $\alpha = 0$, $\Gamma = 0$, and at $V_{\infty} = 1$, $\alpha = \pi/2$, $\Gamma = 0$, and finally u_r = nondimensional speed of the purely circulatory flow also expressed at times as the value Γ/b . Other mathematical formulas developed by Zhukovskiy are included. The general methods for the calculation of speed at a circulation different from zero are confined in the realization of conformal reflection, provided in the noncirculatory flow, which is connected with considerable calculations. The obtained results enable particularly the finding of the circulatory flow around profiles through the utilization of the experimental value of the noncirculatory potential of speed determined by the method of the electrodynamical analogy.

"On Determining Angle of Flow Outlet From a Profile Lattice,"
by M. I. Zhukovskiy, Inform. pis'mo Tsentr. n.-i. kotloturb.
in-ta, No 143, 1955, 10 pp (from Referativnyy Zhurnal--Mekh-
anika, No 11, Nov 56, Abstract No 7429, by G. Yu. Stepanov)

"The author examines a method of assigning a point of convergence and determining the angle of outlet B_2 in a plane potential flow of an incompressible fluid through a profile lattice having circular outlet edges. He presents several examples of turbine lattices having good conformity between the computed and experimental values of B_2 .

"The practically applied, simpler, semiempiric means of computing values of β_2 are not mentioned. The author explains the possible difference between computed and experimental values of β_2 as resulting from inaccurate numerical conformal transformations; in fact, this difference is basically explained by the fact that in the flow model which is used, flow separation at the outlet edges and the effect of gas viscosity and compressibility are not considered."

TITLE: On the use of guide vanes with increased thickness of the edges (K voprosy o primeneni utolshchennykh kromok napravlyayushchikh lopatok.)

PERIODICAL: "Energomashinostroyeniye", (Power Machinery Construction), 1957, No. 2, pp. 11 - 13, (U.S.S.R.)

ABSTRACT: The edge losses calculated according to formulae of various authors give differing results. Also, in evaluating the influence of the thickness of the outlet edges on the operation of guide vanes, the outflow angle of the stream is frequently neglected: equally, the advantages and disadvantages of various methods of designing these angles are disregarded. Developments in gas turbine and steam turbine construction bring about the necessity of using blades with relatively thick outlet edges. The authors show the advisability of designing the outlet edges of guide vanes by methods which lead to smaller outlet angles. The methods described here were investigated by the authors in the Central Boiler-turbine Research Institute (TSKTI) in 1955. The method is considered which, for a certain range of changes of the relative pitch t and of the setting angle of the blades permits the use of edges of various thicknesses with equal losses of power. Thickening the outlet edge of the blades is fully advisable to increase the power.

TITLE: Calculation of axisymmetric flow in an axial-flow turbomachine stage

SOURCE: Energomashinostroyeniye, no. 9, 1964, 15-18

TOPIC TAGS: turbomachine, turbocompressor, axial flow turbocompressor,
axisymmetric flow

ABSTRACT: Methods of axisymmetric-flow calculation are set forth, and the results of a calculation of the flow in a long-blade compressor stage are compared with experimental data. The aerodynamic equations are solved by a difference method that differs from other well-known methods by the following peculiarities: (1) The basic set of equations is solved, not transformed and reduced to one equation; (2) The central differences are used; (3) Sliding

Card 1/2

ACCESSION NR: AP4045907

successive approximations are used in solving nonlinear equations by the method of straight lines; (4) It is assumed that the energy loss varies linearly over the z-axis sections; (5) A solution of the constant-flow equation is presented as approximate finite formulas. The axisymmetric flow was calculated for a stage of an experimental axial-flow compressor having $D_{av}/l = 3$, a theoretical pressure of 0, 4, and a reaction step at an average radius of 0.5. The estimated results were found to be in fairly good agreement with experimental data for the middle part of the blade. "The flow was calculated by Engineers S. Sh. Avvakumova and G. G. Soboleva. The stage was developed by Candidate of Technical Sciences M. M. Babkova." Orig. art. has: 5 figures and 29 formulas.

TITLE: Two-dimensional flow of ideal conducting gas in crossed electric and magnetic fields

SOURCE: Zhurnal prikladnoy mekhaniki i tekhnicheskoy fiziki, no. 5, 1965, 40-44

TOPIC TAGS: MHD, electric field, magnetic field, electric conductivity, Reynolds number, approximation method

ABSTRACT: The flow of a two-dimensional, ideal, variable conductivity gas is analyzed, using an approximation technique. The coordinate system for the problem is shown in Fig. 1. All Hall effects are neglected, the applied fields are assumed to be constant, and the electric conductivity is a function of pressure and temperature. The governing hydromagnetic equations are expanded in powers

Card 1/3

 TITLE: Development and experimental investigation of the cascade design of the root
 section of last-stage stator blading of high-capacity steam turbines
 SOURCE: Energomashinostroyeniye, no. 9, 1965, 3-6
 TOPIC TAGS: turbine stator, steam turbine, aerodynamic effect, viscosity
 ABSTRACT: The article presents the results of an experimental
 investigation of the aerodynamic profiling of transonic station-
 ary blading with low energy losses over a wide range of flow
 regimes. Six different cascade designs are compared, and it is
 found that the optimal cascade design is C1 (energy losses
 ~ 0.04), where allowance is made for the effect of viscosity
 and the special features of the flow around trailing edges and
 the profile of the subsonic part of the channel is more carefully
 designed. The profiling of the peripheral rims of the outlet
 section of the channels of the transonic cascades of the stator
 blading was based on specially designed Laval nozzles of minimum
 length, with the flow line being taken at a distance of $0.35 A^*$
 (where A^* is the critical cross section) from the nozzle axis.

TITLE: Analysis by electronic computer of the potential flow
of an incompressible fluid around arbitrary cascades
of blade profiles

PERIODICAL: Teploenergetika, no.5, 1963, 26-30

TEXT: Methods practised at present in the analysis of potential flow around arbitrary cascades of profiles are based either on conformal mapping or on the solution of integral equations. The latter are more suitable for computer programming. The method used at the Central Boiler and Turbine Institute is based on an integral equation formulated by M.I. Zhukovskiy, wherein the unknown function is the velocity potential. The equation constitutes a Fredholm integral equation of the second kind with a continuous core. The continuous core is responsible for a uniform accuracy at all points of the profile. Only the coordinates of the profile and not their derivatives are used. The solution of the equation is unique. A method of successive
